| <p><b>Article History:</b><br/>Received 21/08/2026<br/>Revised -<br/>Accepted 02/09/2026</p> | <p>Pelayanan gawat darurat memiliki lingkup penanganan pasien dalam kondisi penyakit atau cedera serius dan tidak terduga, sehingga harus mengacu pada konsep triage dimana pasien akan dilayani berdasarkan tingkat kegawat daruratannya. Oleh sebab itu perawat tingkatan self-efficacy sangat menentukan seberapa besar kepercayaan perawat terhadap kemampuan yang dimiliki sehingga keyakinan ini yang akan menentukan kualitas kinerja. Penelitian ini bertujuan untuk mengetahui faktor-faktor yang mempengaruhi self efficacy perawat dalam melaksanakan triage. Desain penelitian deskriptif analitik dengan rancangan cross sectional. Penelitian telah dilaksanakan di IGD RSUD Prof. dr. M. Ali Hanafiah SM Batusangkar, pada bulantanggal 1 - 30 Januari 2024. Populasi adalah seluruh perawat yang terdapat di IGD RSUD Prof. dr. M. Ali Hanafiah SM Batusangkar, dengan pengambilan sampel secara total sampling berjumlah 33 orang. Data di kumpulkan dengan menggunakan kuesioner self efficacy yang telah divalidasi dan diolah serta dianalisa menggunakan uji chi-square. Analisa univariat didapatkan 84,8 % responden memiliki pendidikan diploma, (81,8 %) masa kerja lama (&gt; 5 tahun), (60,4 %) mampu dalam pelaksanaan triage di IGD dan 51.5 % memiliki efficacy rendah. Hasil bivariat didapatkan ada hubungan kemampuan dengan self efficacy perawat (<math>p = 0,046</math> dan <math>OR = 6,190</math>), dan tidak ada hubungan pendidikan (<math>p = 1,000</math>) dan masa kerja (<math>p = 0,398</math>) dengan self efficacy perawat. Disimpulkan bahwa faktor yang berhubungan dengan self efficacy perawat adalah kemampuan. Disarankan pada pihak rumah sakit agar dapat memfasilitasi dan memotivasi perawat untuk mengikuti pelatihan-pelatihan sehubungan dengan pelayanan di IGD dan juga meningkatkan pendidikan ke jenjang yang lebih tinggi, untuk lebih meningkatkan kemampuan dan self efficacy mereka dalam melakukan triage.</p> |
| <p><b>Keywords:</b><br/>Kemampuan<br/>Masa Kerja<br/>Pendidikan<br/>Self Efficacy</p>        | <p><b>ABSTRACT</b><br/><i>Emergency services have the scope of treating patients in conditions of serious and unexpected illness or injury, so they must refer to the triage concept where patients will be served based on the level of emergency. Therefore, the level of nurse self-efficacy really determines how much confidence the nurse has in their abilities so that this belief will determine the quality of performance. This research aims to determine the factors that influence nurses' self-efficacy in carrying out triage. Analytical descriptive research design with a cross sectional design. The research was carried out in the emergency room of Prof. Hospital. Dr. M. Ali Hanafiah SM Batusangkar, in 1 - 30 January 2024. The population is all nurses in the emergency room at Prof. Hospital.</i></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

---

*Dr. M. Ali Hanafiah SM Batusangkar, with a total sampling of 33 people. Data was collected using a self-efficacy questionnaire and processed and analyzed using the chi-square test. Univariate analysis showed that 84.8% of respondents had a diploma education, (81.8%) had long work experience (> 5 years), (60.4%) were capable of carrying out triage in the ER and 51.5% had low efficacy. Bivariate results showed that there was a relationship between ability and nurses' self-efficacy ( $p = 0.046$  and  $OR = 6.190$ ), and there was no relationship between education ( $p = 1.000$ ) and length of service ( $p = 0.398$ ) with nurses' self-efficacy. It was concluded that the factor related to nurse self-efficacy was ability. It is recommended that hospitals facilitate and motivate nurses to take part in training related to emergency services and also increase their education to a higher level, to further improve their ability and self-efficacy in carrying out triage.*
